

Confidence to achieve

Achieving successful outcomes from your strategic IT investment comes from thinking about quality every step of the way – beginning with the end in mind.

From our experience working with many of New Zealand's leading brands we can help you understand best practice in planning and achieving success in your IT projects.

Qual IT's range of services provide informed and timely tools, resources and advice through every stage of your IT projects, helping you to mitigate risk within your IT projects, and enabling you to grasp potential opportunities.

We are the trusted advisor that works alongside you as your organisation grows.

Achieving quality through IT projects

Whether you're buying the latest mobile technology, modernising a creaking legacy platform or just maintaining existing systems, you're thinking about IT change. Successful IT projects look to address testing and quality assurance right from the outset.

As you kick off your project you'll be focussed on building your business case, defining your user requirements, the delivery plan and your overarching project governance. Alongside that you'll be looking at assembling a team to deliver it.

A successful delivery phase should incorporate thorough testing throughout, as well as a sound governance and decision making process to evaluate, and make decisions based on the outputs from these testing and

assurance activities.

As you draw closer to your go-live date you'll be looking for assurance from your project team that your solution is ready. We've all seen the headlines when a high profile technology project goes wrong, and none of us want to be in that situation.

Historically, many organisations have overlooked the total cost of ownership of their solutions, neglecting to consider the on-going support and maintenance implications of what they are delivering. Through beginning with the end in mind, these implications should be recognised and addressed during the earliest phases of your project, to ensure your solutions total cost of ownership is fully understood.

We're ready at any stage

Qual IT will take you through the journey of your project from business case preparation, to implementation and beyond. With different services at different touch points, we can help ensure the quality of delivery right from the start.

We can help set up sound and practical business change governance as well as show you how to develop organisational test policies and enterprise test strategies that fit with the way you deliver your projects and take into account your tolerance for business risk.

Qual IT can work with you to make sure that you've got a test strategy and plan that meets your needs and addresses your risks. Whether your own in-house test team needs some additional resource or specialist skills, or you need a test partner to own or share

responsibility for all your testing outcomes, Qual IT has working examples of different models of delivering testing successfully.

We work with clients to tailor a pragmatic approach that encompasses the most appropriate test and assurance roles, test types and test techniques to ensure your systems function as expected and continue to work seamlessly for end users. Whether you're looking for good application functional testers or you're after more specialist integration testers, infrastructure testers or performance testers give us a call and we can show you the profiles of some of our team.

With a strong focus on the objective measurement of business risk, your Qual IT testers will be making sure that you have the right information about system

quality, so you understand the impact of any potential issues and can make informed judgement calls that are right for your business.

We'll make sure there's a continuous focus on optimising delivery and reducing your testing costs. We use strategies that address common issues such as poor time to market through the effective use of test tools and technology, knowledge sharing and focussed IP retention.

We always work collaboratively with your own staff and are able to bring our world-class test capability development frameworks to ensure you realise the benefits of adopting a testing culture in your organisation.
